Steven Cassamajor

AI Platforms & Developer Productivity

career.walmart@cassamajor.family

Throughout my career, I've built tools that developers adopt to 4x their productivity and effectiveness. I have deep technical knowledge of how LLMs are built, and practical experience building agentic AI architecture.

More importantly, I have experience leading and contributing to small teams with large impact, and care deeply about mentoring peers and building lasting relationships with customers.

Go, Python, and Typescript are my programming languages of choice.

Experience

Ibotta · SENIOR INFRASTRUCTURE ENGINEER — November 2022 – September 2024

- Led a cross-functional team of 10 engineers to reduce risk (non-compliance, inefficient tooling, unclear capabilities) and increase effectiveness across an engineering organization of ~850 members.
- Interviewed stakeholders to contextualize how past decisions influenced current pain points, and applied Product Management concepts (customer discovery, problem framing, roadmap trade-offs) to platform strategy and adoption campaigns.
- Standardized Golden Paths for compliance/security, CI/CD, API tests, Kubernetes health checks, and Terraform code using repository templates served via an Internal Developer Portal (Backstage).
- Built a Go-based repository scanner to analyze Terraform module usage across ~1,000 repositories; used the data to prioritize module maintenance/deprecation and notify service owners with upgrade guidance, accelerating Golden Path adoption.
- Mentored 4 engineers, represented the company at career fairs, and participated in internal engineering conferences to share knowledge and foster a collaborative/inclusive work environment.

Garner · PLATFORM ENGINEER — February 2022 – September 2022

- Maintained GitLab CI/CD pipelines, Kubernetes clusters, Grafana dashboards, and Terraform modules consumed by internal developers.

Twilio · SYSTEMS ADMINISTRATOR II — January 2021 – February 2022

- Authored and maintained capacity planning, disaster recovery, and business continuity plans for critical systems.
- Participated in incident response, on-call rotations, and post-incident reviews to improve system resilience.
- Automated the provisioning and management of servers, storage, networks, and related systems using SaltStack and Terraform.
- Developed tools and processes for automated deployment, configuration, monitoring, and alerting.
- Shared technical expertise and mentored team members to strengthen internal capabilities including systems integration and automation best practices.

Ionic Security · MULTIPLE ROLES November 2015 – January 2021

Senior Systems Engineer March 2019 – January 2021

- Refactored Python 2 modules into Python 3 packages following best practices for Test Driven Development (TDD) and Object-Oriented Programming (OOP); increased test coverage from 3% to 89% and reduced build time by 77% across 4 repositories.
- Consolidated Developer environments which reduced annual operating cost by over $85,000.
- Built a Python SDK for Machina Management APIs and developed tooling (Offprem, ParserConfig) to simplify developer workflows.
- Facilitated collaboration between Infrastructure Engineering, Platform Engineering, and Production Operations to enable each team to reduce technical debt, improve build jobs effectiveness, and implement mature engineering practices.

Systems Engineer May 2017 – March 2019

- Enforced consistency across 200+ servers running RHEL/CentOS/Ubuntu on multiple cloud providers (AWS and GCP) utilizing Jenkins, SaltStack, Ansible, and Terraform.
- Continuously analyzed and improved infrastructure efficiency, scalability, and performance.

NOC Engineer November 2015 – May 2017

- Cultivated high-trust relationships with C-level executives and cross-functional peers as one of three founding members of the Network Operations Center.
- Supported quality assurance by performing User Acceptance Testing (UAT) on applications prior to release, which improved application functionality and customer experience.
- Monitored and debugged application servers; prevented service downtime and upheld SLAs.

Network Axis · ENTREPRENEUR June 2017 – July 2021

- Conducted penetration tests, risk assessments, and provided cyber security education to non-profit organizations as a Trusted Advisor.

Projects

- **Harness Engineering Lab**: A harness built against a small app with seeded violations; used to verify sensor detection and remediation. Findings from sensors are rewritten into agent-facing guidance to automate the feedback loop and correct model behavior.
- **agentic**: An open-source agent framework written in Go, with custom tool-calling and local LLM integration.
- **eBPF playground**: Exploring the intersection between eBPF, XDP, and bare-metal Kubernetes networking. Talos Linux is used for cluster automation.

Education

BBA in Information Security & Assurance · KENNESAW STATE UNIVERSITY May 2017
